

Working with Decimals

$$12 \times \frac{5}{7} ?$$
$$\frac{5}{7} = 12 \times 5 \div 7$$
$$= 60 \div 7$$
$$= \frac{60}{7}$$
$$= 8 \frac{4}{7}$$

Common core icons

This icon indicates a slide where the Standards for Mathematical Practice are being developed. Details of these are given in the Notes field.

Slides containing examples of mathematical modeling are marked with this stamp.

This icon indicates an opportunity for discussion or group work.

The **Standards for Mathematical Practice** outlined in the Common Core State Standards for Mathematics describe varieties of expertise that mathematics educators at all levels should seek to develop in their students.

These are:

- 1) **Make sense of problems and persevere in solving them.**
- 2) **Reason abstractly and quantitatively.**
- 3) **Construct viable arguments and critique the reasoning of others.**
- 4) **Model with mathematics.**
- 5) **Use appropriate tools strategically.**
- 6) **Attend to precision.**
- 7) **Look for and make use of structure.**
- 8) **Look for and express regularity in repeated reasoning.**

How could we check each answer?

Adding and subtracting decimals

Drag the numbers into the correct places in the problem.

3 1 6 9

4 0 0.8

2 5.9 9

+

Jack is doing some woodworking.
He buys a 3 m length of wood.
Jack needs to cut off two pieces of wood –
one of length 0.7 m and one of length 1.92 m.

What is the total length of wood that Jack needs to cut off?

$$\begin{array}{r} 0.70 \\ + 1.92 \\ \hline 2.62 \\ \hline 1 \end{array}$$

Jack needs to cut off 2.62 m altogether.

What is the length of the piece of wood that is left over?

$$\begin{array}{r} 2.9 \\ \cancel{3.00} \\ - 2.62 \\ \hline 0.38 \\ \hline \end{array}$$

The leftover wood will measure 0.38 m (or 38 cm).

Writing an equivalent calculation

It is often easier to work with whole numbers than decimals.
How can we convert decimals into equivalent whole numbers?

We can convert decimals into equivalent whole numbers by multiplying them by 10, 100 or 1000.

What is $36.8 \div 0.4$?

We can write $36.8 \div 0.4$ as

$$\frac{36.8}{0.4} = \frac{368}{4}$$

The diagram shows two orange curved arrows indicating the multiplication by 10. One arrow points from 36.8 to 368, and the other points from 0.4 to 4.

$36.8 \div 0.4$ is equivalent to $368 \div 4 = 92$

Find the equivalent calculation

Which calculation is equivalent to $81 \div 9$?

$$8.1 \div 9$$

$$810 \div 9$$

$$81 \div 90$$

$$810 \div 90$$

We can use equivalent calculations when multiplying decimals to allow us to use the standard column method.

What is 2.28×7 ?

Start by finding an approximate answer: $2.28 \times 7 \approx 2 \times 7 = 14$

2.28×7 is equivalent to $228 \times 7 \div 100$

$$\begin{array}{r} 228 \\ \times 7 \\ \hline 1596 \\ \hline 15 \end{array}$$

Answer

$$2.28 \times 7 = 1596 \div 100 = \mathbf{15.96}$$

Multiplying decimals: grid method

Calculate: $4 \times 7.1 = 4 \times (7 + 0.1)$

$$4 \begin{array}{|c|c|} \hline & \\ \hline \end{array} + \begin{array}{|c|} \hline \\ \hline \end{array} = \begin{array}{|c|} \hline \\ \hline \\ \hline \end{array}$$

The diagram shows a grid method for multiplication. On the left, the number 4 is written to the left of a grid. The grid is a rectangle divided into two columns by a vertical dashed line. Above the left column is the number 7, and above the right column is the number 0.1. To the right of the grid is a plus sign, followed by an equals sign. To the right of the equals sign is a vertical stack of two empty rectangular boxes, with a horizontal line between them, representing the result of the multiplication.

How could we check each answer?

Dividing decimals: short division

One way to divide decimals is using the familiar short division method.

What is $714.06 \div 9$?

Start by finding an approximate answer:

$$714.06 \div 9 \approx 720 \div 9 = 80$$

$$\begin{array}{r} 079.34 \\ 9 \overline{)714.06} \end{array}$$

$$714.06 \div 9 = 79.34$$

How could we check each answer?

Michael is having a birthday party, and wants to give each of his guests a toy kazoo as a party favor. At the party shop, kazoos cost 46¢ each. Michael has \$8.12 in his pocket. How many kazoos can he buy?

First we must decide what the question is asking.

How many times does 0.46 go into 8.12?

Calculate $8.12 \div 0.46$.

Use one of the methods you have learned to find the answer.

Decimals in context

MODELING

Estimate: $8 \div 0.5 = 16$

Equivalent calculation: $8.12 \div 0.46 = 812 \div 46$

$$\begin{array}{r} 46 \overline{) 812} \\ \underline{- 460} \\ 352 \\ \underline{- 322} \\ 30.0 \\ \underline{- 27.6} \\ 2.40 \\ \underline{- 2.30} \\ 0.10 \end{array}$$

10×46
 7×46
 0.6×46
 0.05×46

$$8.12 \div 0.43 = 17.65 \text{ R } 0.1$$

Michael can buy 17 kazoos.

How much money does Michael have left over?
